Certifications

ASP.NET MVC 5 - 20 horas
Testes de Aceitação com Selenium.NET - 4 horas
Testes de Unidade e TDD em .NET - 12 horas
Entity Framework - 16 horas
Design Patterns para bons programadores em C

Gabriel Tiburcio

Senior Software Engineer | Technical Leadership | Distributed Systems | High-Scale Backend Services | .NET | AWS | Kubernetes
São Paulo, Brasil

Resumo

Senior Software Engineer with experience building and leading business-critical systems across financial services, fintech, and public sector environments. Throughout my career, I have worked across the full software delivery lifecycle — from requirements gathering and solution design to development, deployment, production support, and technical leadership. I specialize in bridging the gap between business and technology, translating complex financial, operational, and regulatory requirements into reliable and scalable software systems. My background includes backend development with .NET, SQL Server, AWS, systems integration, and enterprise architecture. I have led technical initiatives, coordinated development teams, and worked directly with business stakeholders in domains such as finance, controllership, regulatory reporting, procurement, and wealth management platforms. Over time, my role has evolved beyond software delivery into technical leadership and cross-functional influence, contributing to architecture decisions, backlog prioritization, technology choices, and strategic discussions within engineering organizations. Technology has been a lifelong passion of mine. It started in childhood, taking computers apart to understand how they worked, and continues today through solving complex problems and building systems that simplify and scale critical business operations.

Experiência

ASA

Senior Software Engineer
janeiro de 2026 - Present (8 meses)

Banco ABC Brasil

Technical Lead / Senior Software Engineer
dezembro de 2020 - janeiro de 2026 (5 anos 2 meses)

I joined Banco ABC Brasil as a contractor through Talent4, contributing to strategic initiatives across multiple business domains, including energy trading, pricing systems, and financial management platforms.

One of the key projects I delivered was the Management Results platform, responsible for calculating financial results and variable compensation for relationship managers. Due to its direct impact on official financial reporting and compensation calculations, the solution required a high degree of accuracy and business alignment. Following the successful delivery of this and other strategic projects, I received a direct employment offer from the bank.

As part of the Finance Technology team, I supported systems across Finance, Controllershship, Regulatory Reporting, Accounting Standards, Provisioning (PDD), and Loss Control, including applications involved in regulatory reporting processes submitted to the Central Bank of Brazil.

Over time, I became the team's Technical Lead, responsible for technical decisions, backlog prioritization, code reviews, stakeholder alignment, solution design, and mentoring developers.

One of the most significant initiatives I led was the implementation of the bank's Coupa integration platform, connecting procurement workflows with supplier management, employee records, chart of accounts, accounts payable, and payment processing systems.

The solution leveraged APIs, scheduled jobs, database procedures, SNS topics, and SQS queues to eliminate manual processes, reduce operational risks, improve data consistency, and automate critical business workflows.

Throughout this period, I became a key technical reference within the Finance Technology team, combining software engineering, business understanding, system ownership, and technical leadership in a highly regulated financial environment.

Talent Four Consulting

Senior Software Engineer

outubro de 2020 - julho de 2022 (1 ano 10 meses)

I worked as a Software Engineer through Talent4, being allocated to multiple client engagements in the financial sector.

Banco Master (short-term engagement)

Banco ABC Brasil (long-term engagement)

Banco Master

Senior Software Engineer (Contract via Talent4)

outubro de 2020 - dezembro de 2020 (3 meses)

I worked as a Software Engineer through Talent4, allocated to Banco Master for a short-term engagement focused on backend automation for the card operations area.

Bayer

Software Engineer (Outsourced via DevPartner)

setembro de 2019 - outubro de 2020 (1 ano 2 meses)

San Paolo, SP

I worked as an outsourced Software Engineer at Bayer through DevPartner, contributing to enterprise software initiatives in the agribusiness domain.

During this period, I was part of a Scrum team working with continuous delivery practices, participating in sprint planning, backlog refinement, and iterative development cycles.

Devpartner

Software Engineer

setembro de 2019 - outubro de 2020 (1 ano 2 meses)

São Paulo, Brasil

Assigned to Bayer project, working as Software Engineer in an outsourced capacity.

Cantec Soluções Web

Founder / Software Engineer

janeiro de 2015 - junho de 2019 (4 anos 6 meses)

São Paulo

I co-founded CANTEC with Dennis Canteli, building a software house specialized in solutions for public procurement, contracts, and government-related systems.

During this period, I was responsible for the full lifecycle of the business and product delivery including solution design, software development, client negotiations, proposal writing (public tenders), contracting processes, financial management, and ongoing client delivery.

From a technical perspective, I developed and delivered end-to-end systems tailored to public sector requirements, working with institutions such as the State Audit Court of Sergipe, municipal sanitation organizations, public health institutions, and cooperative systems.

This experience significantly expanded my non-technical skills, including stakeholder management, negotiation, and business operations, while reinforcing my ability to deliver software in highly regulated and bureaucratic environments.

Avivatec

Full-Stack Software Developer (C# / Angular)

fevereiro de 2015 - janeiro de 2016 (1 ano)

Paradiso, SP

At AVIVATEC, I worked as a full-stack developer, contributing to multiple client projects across backend and frontend development using C#, ASP.NET MVC, and Angular.

During this period, I had the opportunity to work closely with an experienced engineer who acted as an informal mentor, which significantly accelerated my growth in API design, MVC architecture, and backend development practices.

One of the most relevant projects I worked on was for Kroton Group, one of the largest private education organizations in Brazil, which operates multiple universities. The system focused on automating student enrollment tracking across these institutions and generating managerial reports, with special attention to FIES-funded students.

B2U Sistemas

Software Developer (C# / Angular)

2014 - janeiro de 2015 (1 ano)

São Paulo, Brasil

I worked on a short-term engagement contributing to a retail platform project for major global brands, including Nike, M.Officer and Adidas, focused on point-of-sale (POS) management and store operations.

RCC Licitações

Software Developer (C#) / IT Support Analyst

maio de 2013 - agosto de 2014 (1 ano 4 meses)

San Paolo, SP

I started my career in IT supporting infrastructure operations, including hardware maintenance, network troubleshooting, cabling, and user management through Active Directory, including GPO configuration and access control.

After one year, I transitioned to the software development team (C#), where I worked on building automation systems responsible for collecting public procurement and bidding data from government websites.

My main responsibility was developing web automation bots to extract, categorize, and store bidding information into databases, making it available for clients through internal systems.

One of my key achievements was implementing automation mechanisms capable of handling CAPTCHA-protected websites, significantly reducing manual effort in data collection processes and improving coverage and efficiency of procurement monitoring systems.

This role gave me strong foundations in backend development, system automation, data extraction, and working with legacy infrastructure constraints in real-world production environments.

Formação acadêmica

FIAP

Master of Business Administration - MBA, Engenharia de Software · (2025 - 2026)

UNIP

Curso Superior de Tecnologia (CST), Análise e Desenvolvimento de Sistemas · (2021 - agosto de 2023)
